

# BIOSYNC CLINICAL LABORATORY REPORT

Patient: Jordan Riley (DOB: 04/11/2003) | Date: January 21, 2026

## Vital Signs & Biometric Readings

|                |             |
|----------------|-------------|
| Heart Rate     | 96 BPM      |
| Blood Pressure | 128/84 mmHg |
| SpO2           | 95%         |
| Temperature    | 100.2°F     |
| Glucose        | 94 mg/dL    |
| Weight         | 125 lbs     |
| BMI            | 20.8        |
| HRV            | 42 ms       |

## Clinical Notes

Patient presents with complaints of worsening joint pain in hands and knees, butterfly rash on face, and significant fatigue over the past 10 days — consistent with lupus flare. Currently on Hydroxychloroquine 200mg twice daily, Methotrexate 15mg weekly, Prednisone 5mg daily, Folic Acid 1mg daily, Sertraline 50mg, Ferrous Sulfate 325mg. Heart rate elevated at 96 BPM — consistent with inflammatory state. Blood pressure 128/84 mmHg mildly elevated. SpO2 95% acceptable but lower than baseline — pleuritis possible given lupus history. Temperature 100.2°F — low grade fever consistent with lupus flare, infection ruled out. Weight loss of 2 lbs since December — appetite suppressed during flare. HRV 42 ms decreased from baseline, reflecting physiological stress. Anxiety symptoms worsened per patient report.

## Provider Notes

Lupus flare confirmed. Prednisone increased to 20mg daily for 2 weeks then taper to 10mg. Methotrexate dose review at next visit — consider increase to 17.5mg if flare persists. Rest and hydration advised. Patient instructed to avoid triggers including UV exposure and stress. Sertraline dose held — recheck anxiety at follow-up. ANA and anti-dsDNA titers ordered. CBC and CMP ordered to monitor Methotrexate toxicity. Follow-up in 3 weeks. Ordering Provider: Dr. Sandra Okeke, MD — Rheumatology. Facility: BioSync Clinical Health Center
